

TRACING THE GROWTH OF THE GLOBAL COMMUNITY: A POPULATION FORECASTING ANALYSIS

1. INTRODUCTION

In recent decades, the world has seen tremendous changes in the size and distribution of its population. The global community has grown larger and more interconnected, with people from different countries and cultures interacting with each other more frequently than ever before. In this analysis, we will trace the growth of the global community through population forecasting.

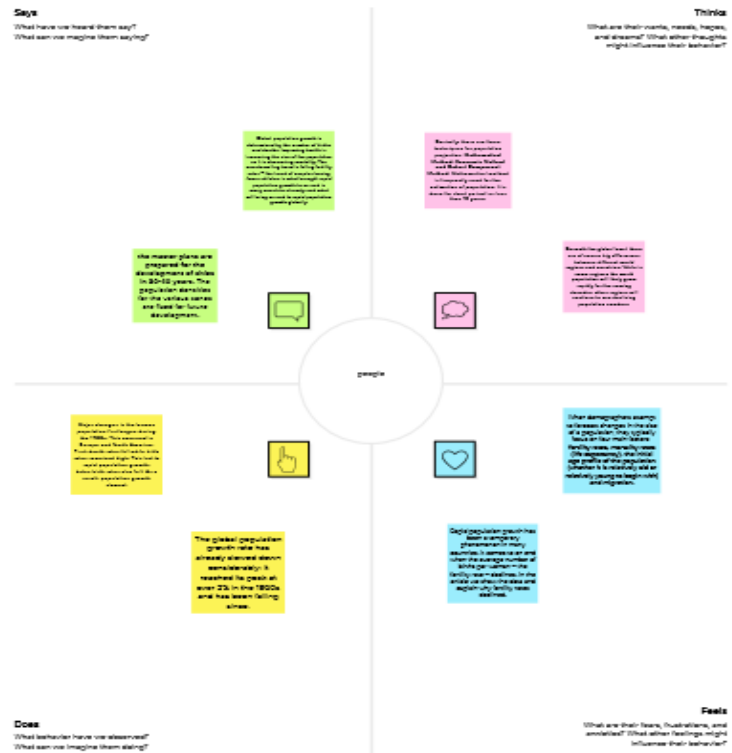

We will examine the historical trends in population growth and migration, as well as the factors that have contributed to these trends. We will also explore the potential future of the global community, considering how changing demographics and social dynamics may shape the population in the coming years.

By understanding the factors driving population growth and migration, we can gain insight into the changing nature of the global community and the challenges and opportunities that lie ahead. This analysis aims to provide a comprehensive overview of the growth of the global community, highlighting the trends and patterns that have emerged over time and what we might expect in the years to come.

2. EMPATHY MAP

Empathy map

Use this framework to develop a deep, shared understanding and empathy for other people. An empathy map helps describe the aspects of a user's experience, needs and pain points, to quickly understand your users' experience and mindset.

3. BRAINSTROM AND IDEA PRIORITIZATION

1 Define your problem statement

What is the problem you are trying to solve? Please your problem as a challenge to be solved. This will be the focus of your brainstorm.

Example:

Problem Statement

How can we improve the efficiency of our production process?

2 Key ideas of brainstorming

Brainstorming is a creative technique for generating ideas. It involves a group of people working together to generate a large number of ideas, often in a short period of time. The key ideas of brainstorming are:

- Quantity over quality: The more ideas, the better.
- No criticism: No idea is too silly or too stupid.
- Encourage wild ideas: The more creative, the better.
- Build on others' ideas: Ideas can be combined and improved.
- One idea at a time: Focus on one idea at a time.

3 Brainstorm

Bring ideas to the table. Brainstorming is a creative technique for generating ideas. It involves a group of people working together to generate a large number of ideas, often in a short period of time. The key ideas of brainstorming are:

Person 1: I think we should consider using a different material for the production process. Maybe a lighter material that is easier to work with.

Person 2: I think we should consider using a different machine for the production process. Maybe a more efficient one that can produce more in less time.

Person 3: I think we should consider using a different process for the production process. Maybe a more automated one that can reduce the need for manual labor.

Person 4: I think we should consider using a different location for the production process. Maybe a more central one that is easier to access.

Person 5: I think we should consider using a different time for the production process. Maybe a more convenient one that is easier for the workers to work at.

Example:

Brainstorming Session

Person 1: I think we should consider using a different material for the production process. Maybe a lighter material that is easier to work with.

Person 2: I think we should consider using a different machine for the production process. Maybe a more efficient one that can produce more in less time.

Person 3: I think we should consider using a different process for the production process. Maybe a more automated one that can reduce the need for manual labor.

Person 4: I think we should consider using a different location for the production process. Maybe a more central one that is easier to access.

Person 5: I think we should consider using a different time for the production process. Maybe a more convenient one that is easier for the workers to work at.

4 Prioritize

Now that you have a large number of ideas, it's time to prioritize them. This is done by evaluating each idea based on its potential impact and feasibility. The key ideas of prioritization are:

Impact: How much will this idea improve the production process?

Feasibility: How easy is it to implement this idea?

Example:

Prioritization Matrix

Impact (Y-axis)

Feasibility (X-axis)

Idea 1: High Impact, High Feasibility

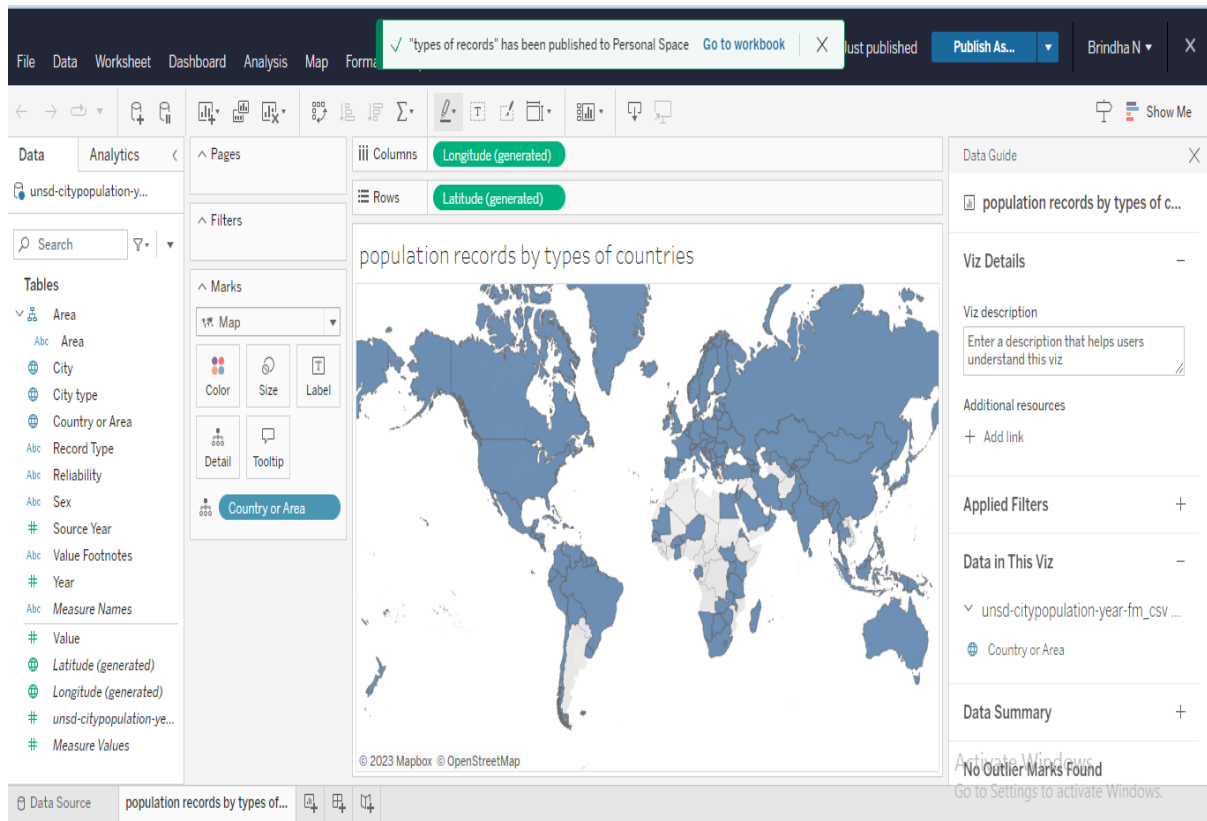

Idea 2: High Impact, Low Feasibility

Idea 3: Low Impact, High Feasibility

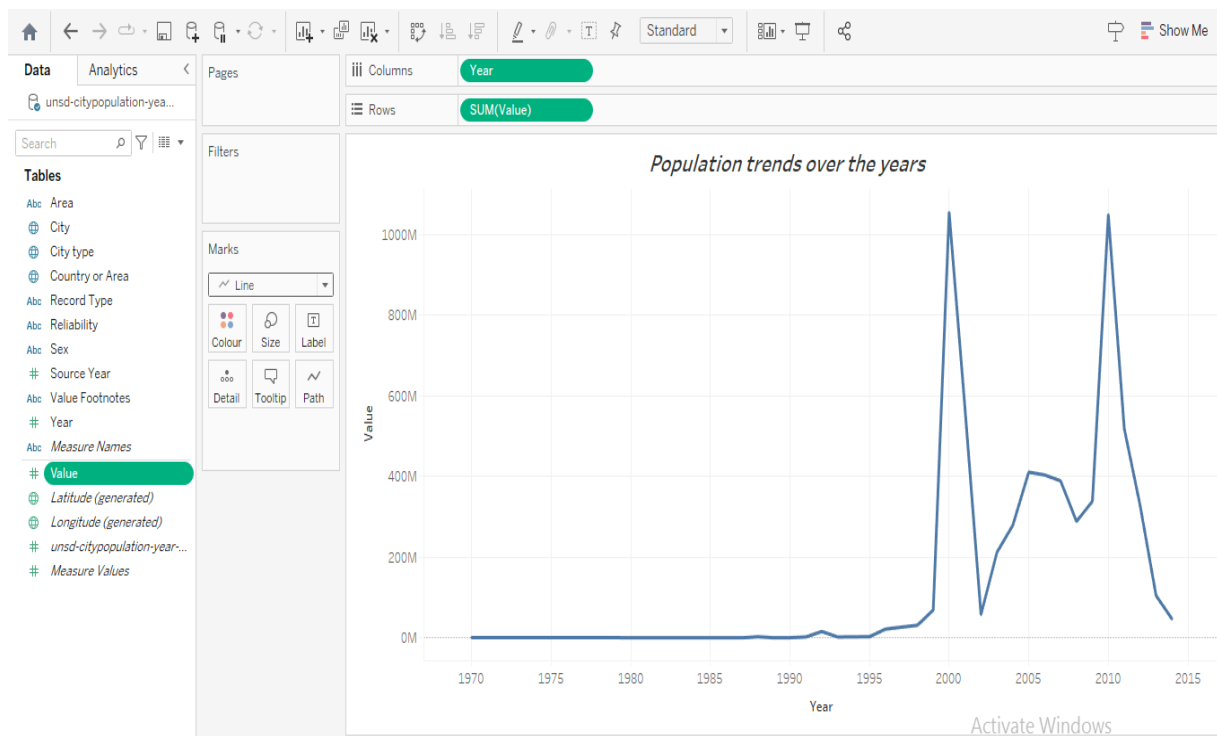

Idea 4: Low Impact, Low Feasibility

4. TABLEAU PUBLIC

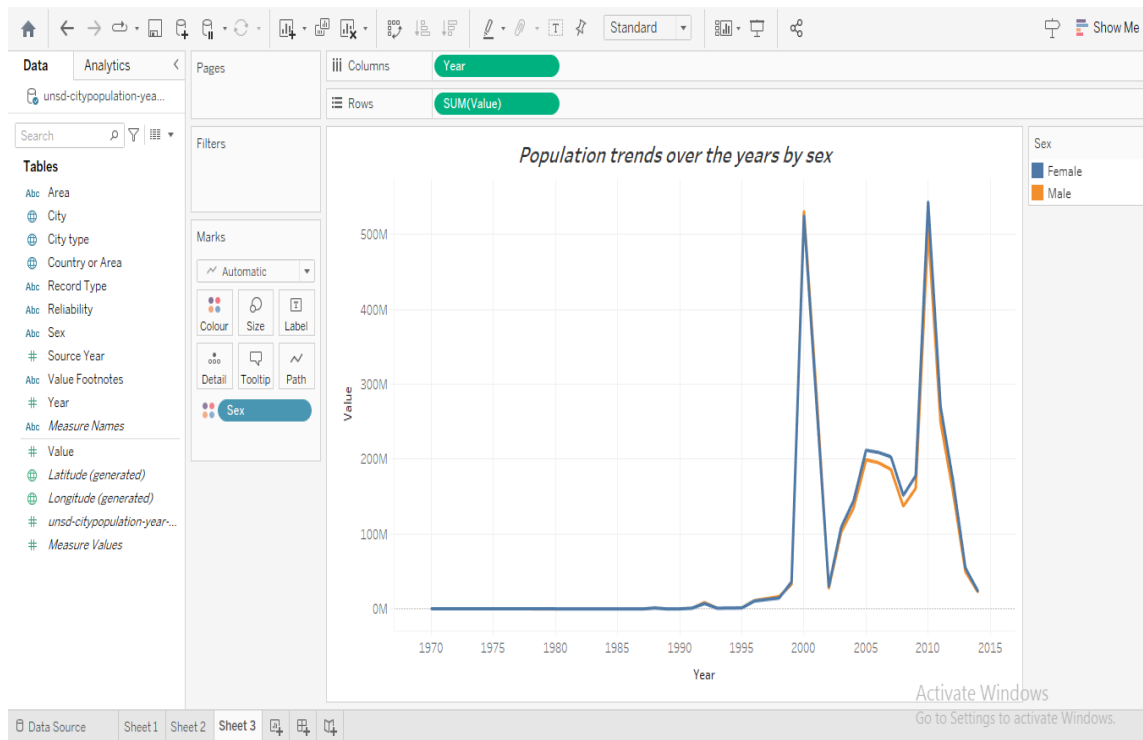

Population records by types of countries

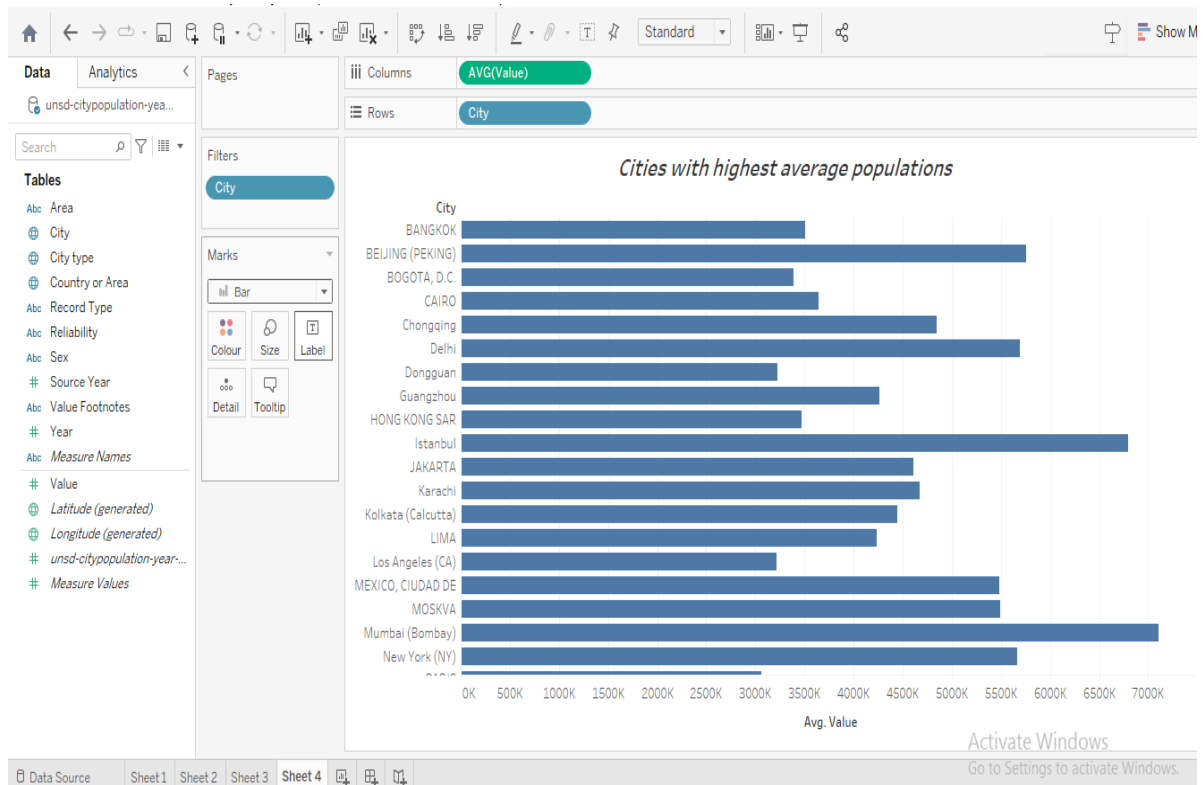

Population trends over the years

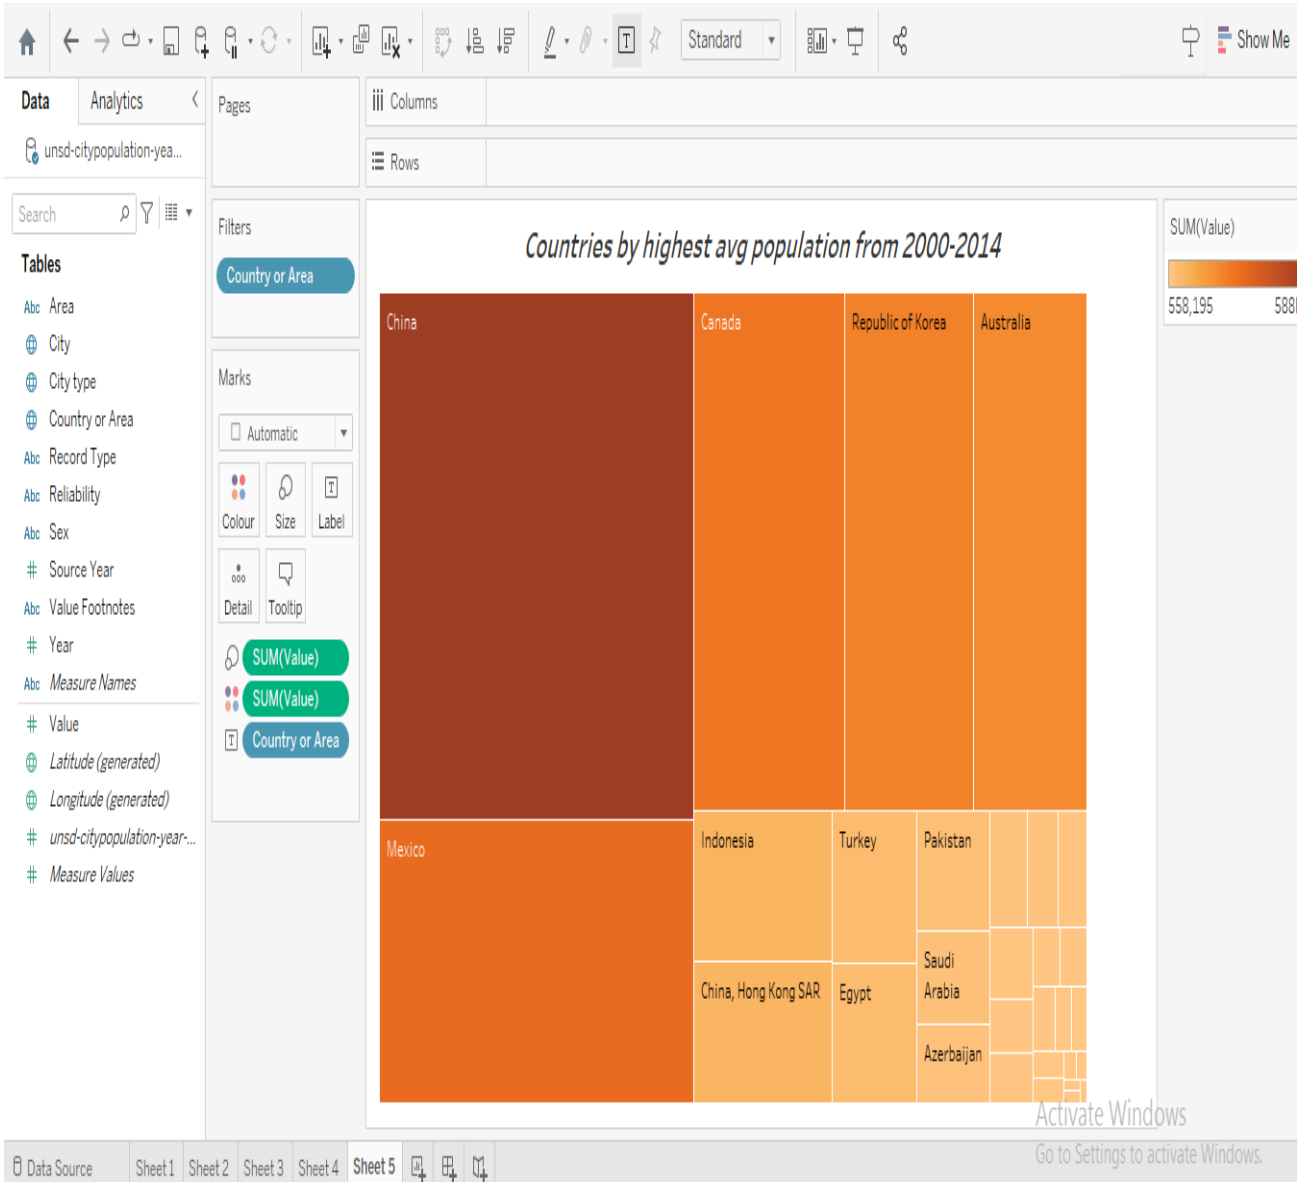

Population trends over the years by sex

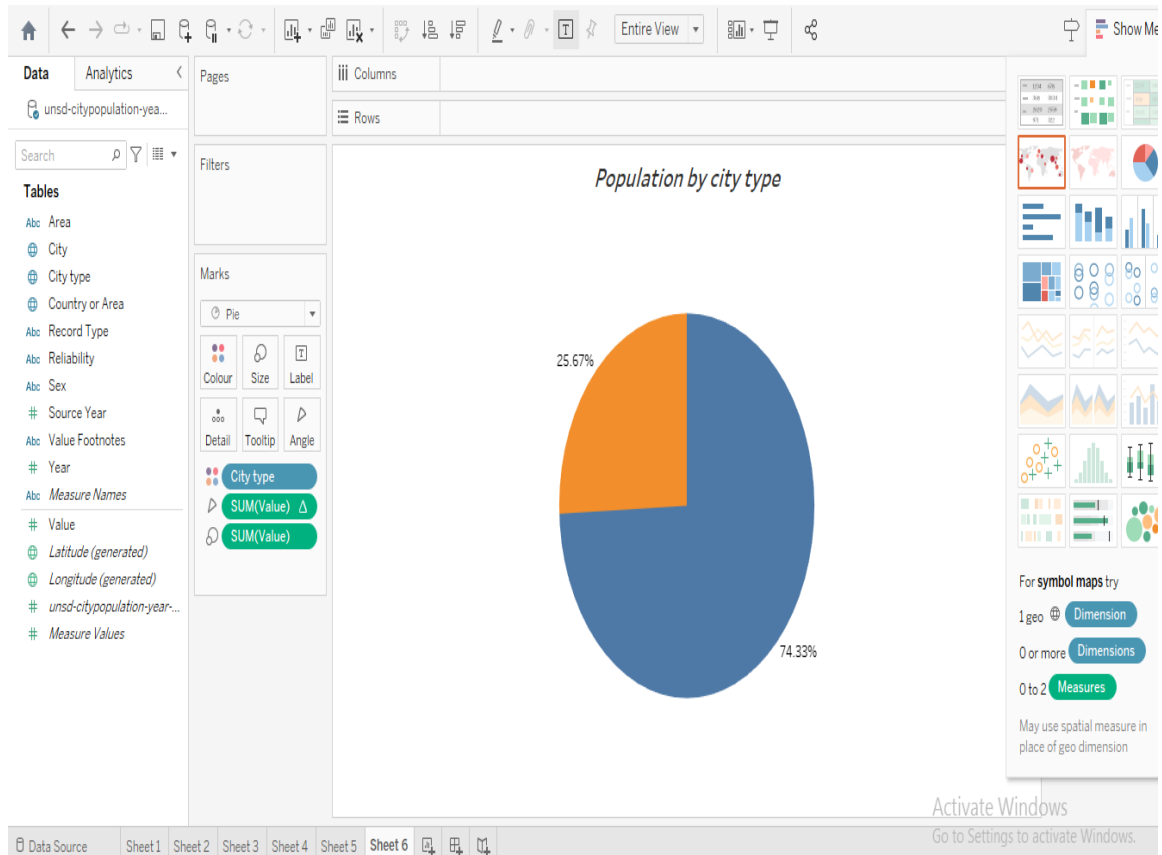

Cities with highest average population

Countries by highest average population from 2000-2014

Population by city type

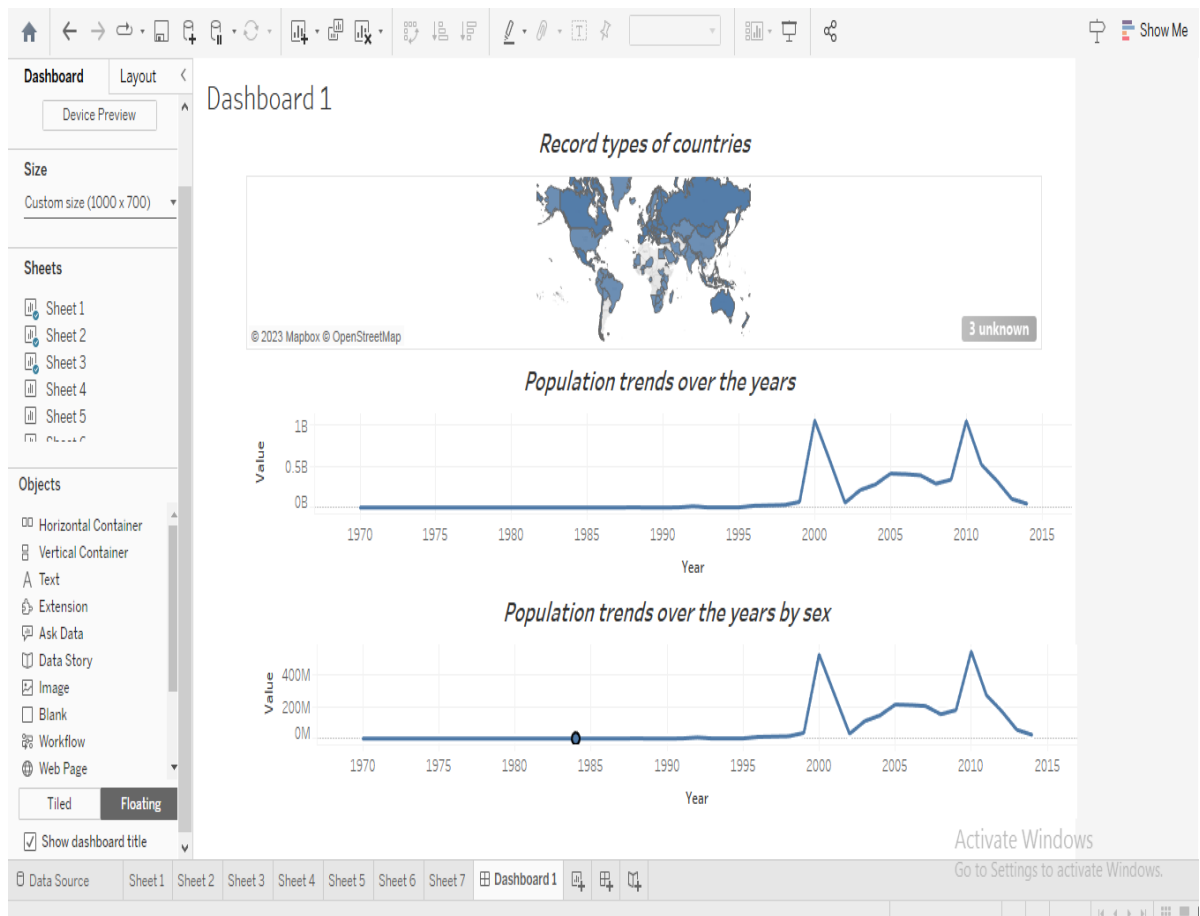

Population of cities by years

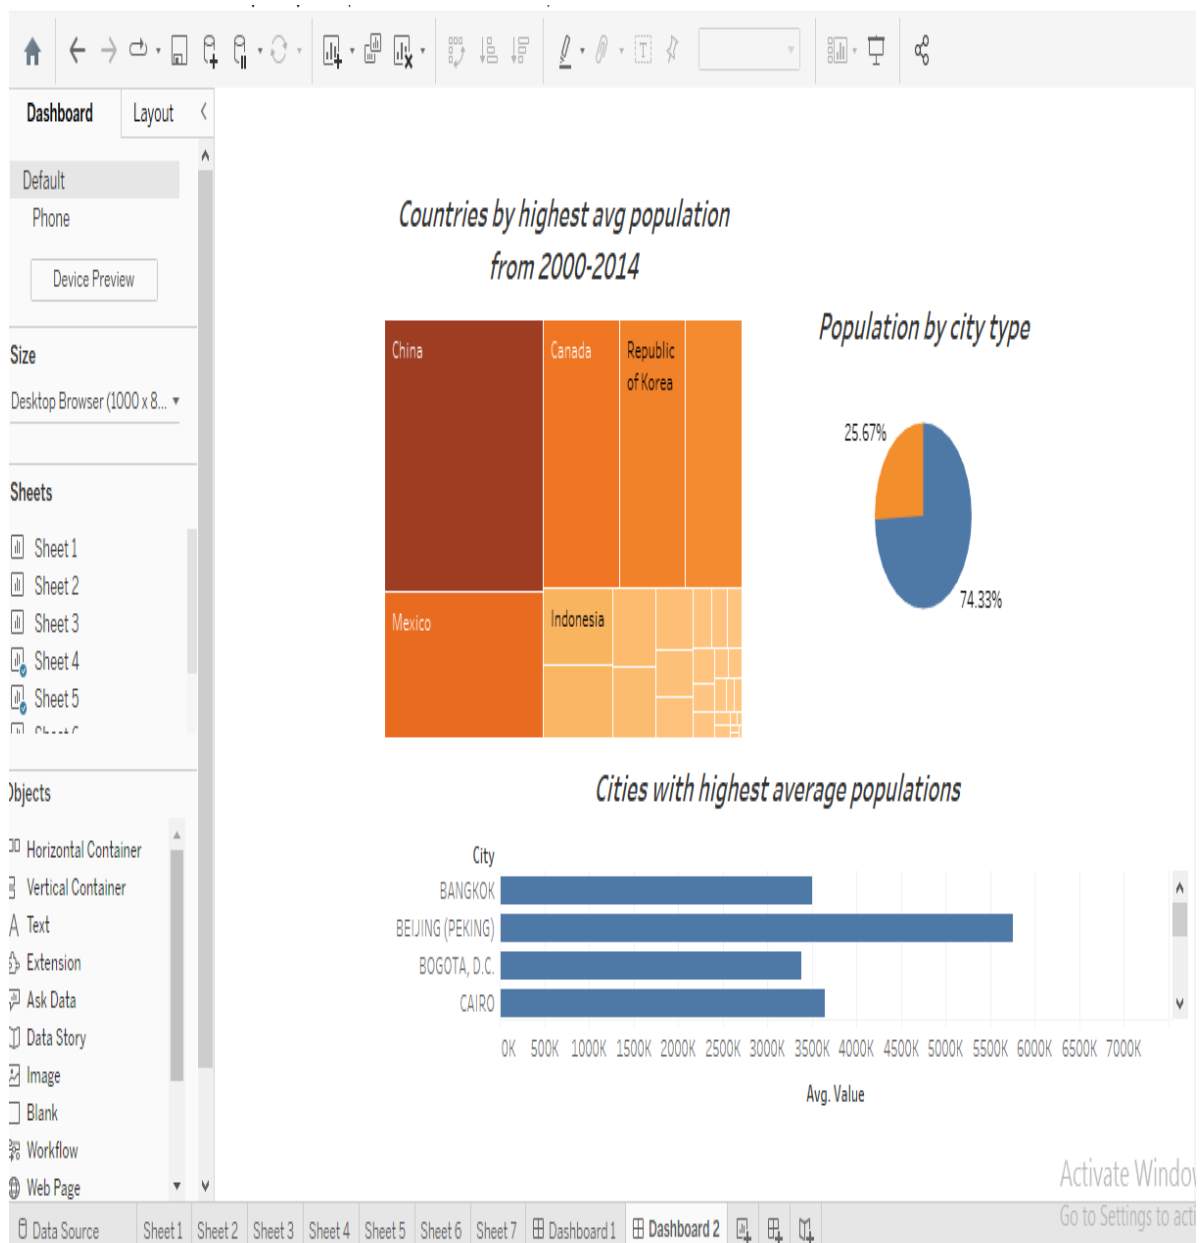

The table displays population data for various cities across different years. The data is organized into columns for City, Country or Area, and Year. The table is titled 'Population of cities by year'.

City	Country or Area	Year
Arusha	United Rep...	
Arvada (CO)	United Stat...	
Asahikawa	Japan	
Asaka	Japan	
Asan	Republic of ...	
Ashdod	Israel	
Ashikaga	Japan	
ASMARA	Eritrea	281,110
Assyut	Egypt	343,662
Aswan	Egypt	219,541
At-Ta'if	Saudi Arabia	
Ath-Thuqbah	Saudi Arabia	
Athens (GA)	United Stat...	
Atlanta (GA)	United Stat...	
Atsugi	Japan	
Atushi	China	200,345
Augsburg	Germany	
Augusta (G.	United Stat...	
Aurora (CO)	United Stat...	
Aurora (IL)	United Stat...

ADVANTAGES & DISADVANTAGES

ADVANTAGES OF POPULATION FORECASTING ANALYSIS

- ❖ Population forecasting analysis can have several advantages, including:
- ❖ **Planning:** Population forecasting analysis can provide valuable information to help planners and policymakers make informed decisions about future needs and resources. It can inform decisions related to healthcare, education, housing, transportation, and other public services.
- ❖ **Resource allocation:** Population forecasting analysis can also help allocate resources in an efficient and effective way. For example, it can help determine the number of schools or hospitals needed in a particular area, or the amount of funding required for social programs.
- ❖ **Economic development:** Population forecasting analysis can inform economic development strategies by providing insights into population growth and demographic changes. This can help businesses make decisions about where to locate and what products or services to offer.
- ❖ **Social policy:** Population forecasting analysis can inform social policy decisions related to aging, migration, and other demographic trends. This can help ensure that policies are aligned with the changing needs of the population.
- ❖ **Preparedness:** Population forecasting analysis can also help communities prepare for emergencies and disasters. By understanding population trends, emergency responders can better prepare for potential challenges and allocate resources more effectively.
- ❖ Overall, population forecasting analysis can provide valuable insights that can inform decision-making across a wide range of sectors and help ensure a more sustainable and resilient future.

DISADVANTAGES OF A POPULATION FORECASTING ANALYSIS

There are several disadvantages to population forecasting analysis, including:

- ❖ **Uncertainty:** Population forecasting is inherently uncertain due to the many variables that can affect population growth, such as migration patterns, changes in birth and death rates, and economic factors. This uncertainty can make it difficult to accurately predict future population trends.
- ❖ **Simplistic assumptions:** Population forecasting models often make simplifying assumptions about the underlying factors that drive population growth, such as assuming that fertility rates will remain constant over time or that migration patterns will remain stable. These assumptions can lead to inaccurate predictions if they are not realistic or fail to capture important trends.
- ❖ **Inadequate data:** Population forecasting requires large amounts of data, including historical population trends, demographic data, and economic data. However, data can be incomplete or unreliable, particularly in developing countries where data collection and reporting systems may be weak or inconsistent.
- ❖ **Political biases:** Population forecasts can be influenced by political biases, particularly when they are used to inform policy decisions. For example, forecasts may be manipulated to support a particular policy agenda or to justify investment in certain regions or industries.
- ❖ **Lack of consideration of social and environmental factors:** Population forecasting models may fail to adequately consider social and environmental factors that can affect population growth and distribution, such as changes in cultural norms, social inequalities, and climate change.
- ❖ **Overall,** while population forecasting can be a useful tool for planning and policy-making, it is important to be aware of its limitations and to use it in conjunction with other sources of information and analysis.

CONCLUSION

It took hundreds of thousands of years for the world population to grow to 1 billion – then in just another 200 years or so, it grew sevenfold. In 2011, the global population reached the 7 billion mark, it stands at almost 7.9 billion in 2021, and it's expected to grow to around 8.5 billion in 2030, 9.7 billion in 2050, and 10.9 billion in 2100.

This dramatic growth has been driven largely by increasing numbers of people surviving to reproductive age, and has been accompanied by major changes in fertility rates, increasing urbanization and accelerating migration. These trends will have far-reaching implications for generations to come.

The recent past has seen enormous changes in fertility rates and life expectancy. In the early 1970s, women had on average 4.5 children each; by 2015, total fertility for the world had fallen to below 2.5 children per woman. Meanwhile, average global life spans have risen, from 64.6 years in the early 1990s to 72.6 years in 2019.

In addition, the world is seeing high levels of urbanization and accelerating migration. 2007 was the first year in which more people lived in urban areas than in rural areas, and by 2050 about 66 per cent of the world population will be living in cities.

These megatrends have far-reaching implications. They affect economic development, employment, income distribution, poverty and social protections. They also affect efforts to ensure universal access to health care, education, housing, sanitation, water, food and energy. To more sustainably address the needs of individuals, policymakers must understand how many people are living on the planet, where they are, how old they are, and how many people will come after them.
